

CONFIDENTIAL · PROPRIETARY CONCEPT

Spotify Jam Map Master Blueprint

A social layer for Spotify that turns listening into a shared, worldwide experience on a live map.

Creator: _____ (GitHub: AlecH7H7)

Date of record: 23 July 2026 · Status: Original concept & working prototype

1 · Ownership & Authorship Declaration

I declare that I am the originator of the concept, feature set, and design described in this document. The working prototype was built and iterated by me. Every stage of development is preserved as a timestamped, authored record in the project's version-control history (see §9).

Signed: _____ Date: _____

2 · Summary

Spotify Jam Map is a social layer for Spotify that turns listening into a shared, worldwide experience on a live map. Like Snapchat's Snap Map, every friend appears as a customizable character wherever they are; when they're listening, their pin glows and shows what's playing in real time. You can send a song straight into a friend's queue, open their music profile, chat, or sync playback and listen together. A signature original feature — the **Cultural Passport** — tracks the percentage of the world's music cultures you've explored (out of ~236 countries), turning global discovery into a game with ranks and leaderboards. Strong privacy controls make it safe and consent-first.

3 · The Problem

Music streaming today is fundamentally **solitary**. Spotify knows what hundreds of millions of people listen to, yet listening is private and disconnected from friends. There is no living, spatial way to see what the people you care about — or the world — are playing right now, to react, or to share a track in the moment. Social discovery happens *outside* the app instead of inside it.

4 · The Solution & Core Concept

- A **living world map** of friends as expressive avatars.
- **In-the-moment sharing** — drop a song into a friend's queue with a swipe.
- **Presence** — you're "online" when you're actually listening.
- A **discovery game** — the Cultural Passport rewards exploring global music.
- **Consent & safety by design** — you control your location and your queue.

The concept reframes Spotify from a private player into a **worldwide social and exploratory network** — the way Stories and Maps transformed other platforms.

5 · Complete Feature Specification

5.1 · Identity & Characters

Custom Bitmoji-style avatar builder: skin tone, 9 hairstyles, hair colour, outfit type (t-shirt, hoodie, leather, denim), outfit colour, facial hair (stubble, mustache, goatee, beard), accessories (glasses, shades, cap, beanie), and **real headphone brands drawn on the character** (AirPods, AirPods Max, Beats, Sony, Bose, JBL, Marshall, Sennheiser, Skullcandy, Galaxy Buds, Shokz). "Surprise me" randomizer and live preview.

5.2 · The World Map

Snapchat-style map with each friend as their avatar at their real location. Live listening state (glowing pulse + equalizer bars); offline state (greyed avatar + "last seen"). Collected countries glow green on the map.

5.3 · Friend Interactions

- **Send a song** — search Spotify's catalogue and **swipe left on a track to drop it into a friend's queue** (the core gesture).
- **Profile** — their recently played songs and playlists.
- **Chat** — private 1:1 messaging with playable shared-song cards.
- **Listen Together** — synchronized real-time playback between two users.
- **Block system** — 2 hours, 24 hours, 7 days, or forever (auto-unblocks).

5.4 · Cultural Passport (signature original feature)

- Every country whose music you hear is **collected** into your passport.
- Your "**% of worldwide cultural listening**" = collected ÷ ~236 countries.
- Progress ring, per-continent breakdown, collected vs. locked country flags.
- **Explorer ranks** (Rookie Listener → Explorer → Wanderer → Globetrotter → World Citizen → Cultural Legend).
- "**Discover a new country**" plays a track from a random unheard culture.
- **Friends leaderboard** ranking who has explored the most of the world.

5.5 · Privacy & Permissions (consent-first design)

- **Ghost Mode** — hide your location; you disappear from everyone's map.
- **Who can add to your Jam** — Everyone, Close friends (trusted list), or No one.
- **Ask First** — incoming song requests appear as an Allow/Deny prompt so no one can troll your queue.

5.6 · Social Graph & Growth

Activity feed of song sends and sessions; add friends via invite link or import from WhatsApp, Snapchat, Instagram, and contacts; real-time notifications throughout.

5.7 · Player & Onboarding

Full playback bar (play, skip, seek, like, volume) showing the user's headphone brand as the active device. Welcome screen plus a 14-step guided tour that auto-demonstrates every feature.

6 · What Makes This Novel

The combination is the invention. Individually notable original elements:

- **The Cultural Passport** — gamifying *global cultural music exploration* as a personal percentage of the world, with ranks, map glows, discovery, and a social leaderboard.
- **Map-native, presence-based sharing** — "online = currently listening," with swipe-to-queue onto a friend's playback.
- **Consent-first queue permissions** — Ghost Mode + tiered add-permissions + per-song approval.
- **The Snapchat × Spotify bridge** — importing a social graph into a music map.

7 · Technical Architecture (as prototyped)

- **Front end:** self-contained web app (HTML/CSS/JS), original SVG avatar engine, Leaflet + CARTO dark map, Web Audio playback previews.
- **Real-time back end (LIVE):** Firebase — anonymous auth, Realtime Database for presence, connections, inboxes, and chat; invite-link flow; live song delivery between real users.

- **Production path:** integrate the official Spotify Web API / Web Playback SDK (OAuth) for real search, queue control, and synced playback.

8 · Business & Partnership Model

- **Primary:** pitch to Spotify as a native social add-on ("Jam Map" tab), licensed or acquired.
- **Partnership:** Snapchat × Spotify collaboration to share the social graph.
- **Standalone:** a companion app connecting to a user's Spotify via OAuth.

9 · Proof of Authorship

- **Version-control history** — every feature committed incrementally, each commit carrying an author identity and immutable timestamp, from inception through each addition.
- **This dated blueprint**, committed to the repository.
- The complete, working prototype itself.

10 · Roadmap

- Integrate official Spotify authentication and playback.
- Ship the LIVE multiplayer version to trusted testers.
- Expand the Cultural Passport dataset and add cultural stamps/achievements.
- Prepare a formal pitch deck and demo video.

11 · CONFIDENTIAL & IP NOTICE — This document and the associated prototype are confidential and proprietary, disclosed only under an expectation of confidence. No license or right to use, copy, distribute, or commercialize any part of this concept is granted by receiving or viewing it.

12 · Disclaimer. This is an authorship and specification record, not a legal instrument, and not legal advice. It helps establish that you authored the concept and when, but does not by itself grant a patent, trademark, or copyright registration. For enforceable protection, consult a qualified IP attorney (e.g. about a provisional patent) and use a signed NDA before sharing. "Spotify" and "Snapchat" are trademarks of their respective owners; this concept is an independent proposal, not affiliated with or endorsed by them.
